Study elements
This section discusses the fundamental questions and issues raised in Hamlets 3, including physical hamlet types, ways of hamlet expansion, why hamlets should or should not expand, factors to consider when choosing the best way to expand, and the need for a clear set of smart methods for planning future hamlet growth.

Defining the Adirondack hamlet
Today’s Adirondack hamlets date from the early 1800s, when pioneers arrived (many from New England, Canada and Europe) to settle the Adirondacks and establish industries to harvest timber, extract mineral resources, and clear land for farming, raising sheep, and other agricultural pursuits. Shipping and commerce boomed with the opening of the Champlain Canal and the development of railroads. Tourism grew alongside resource industries, as the natural beauty of the region drew visitors. The early settlements evolved into the 130 (or so) places that today we call hamlets. They range in size from a little over a hundred in population to 5,000 or more.

The term “hamlet” most commonly refers to a small village or rural settlement that does not have its own elected government. However, defining “hamlet” in the Adirondacks is more complicated, as the term also refers to a state land use classification. In 1973 New York State established the Adirondack Land Use and Development Plan, which divided privately-owned land within the Adirondack Park into six land use classifications, including one called “Hamlet” (colored brown on the land use map). The land use classification “Hamlet” usually coincides with a “hamlet” settlement, but not always. Some “hamlet” settlements are not classified “Hamlet” land use (usually designated Moderate, colored red). And some “Hamlet” land use area is undeveloped land. Also some larger hamlets are incorporated places and are called “villages.”

Using the terms “Hamlet” (land use) and “hamlet” (settlement) can lead to confusion. The distinction is important, however, as legally Hamlet-designated areas afford more density options and less Adirondack Park Agency project jurisdiction. Eighteen of the 92 townships in the Adirondacks have physical “hamlets” but not “Hamlet-designated” areas. As used in Hamlets 3, “hamlet” means a community or physical settlement.
IN THE ADIRONDACKS, “HAMLET” REFERS BOTH TO A LAND USE DESIGNATION AND PHYSICAL PLACE.

HAMLET BROWN

HAMLET RED

Lyon Mt. (colored brown) – both a land use-designated and physical Hamlet.

Wanakena (colored red) – a physical, but not a land-use-designated hamlet.

Why expand a hamlet?
According to research at Cornell University, there are three ways for a rural community to increase its economic vitality: increase per capita income, attract money from outside sources, or grow in population. These growth opportunities require some type of physical expansion whether it is the reuse of a factory, infill housing development, or expanded recreation opportunities.

Not all hamlets will want, or need to expand. Expansion, or the process of increasing a hamlet’s land area, population size, economic base, open space, amenities, and/or service provision, is a factor of supply and demand. In some hamlets, demand for developable land outstrips its supply, which leads to increased land values and decreased affordable housing. In other instances, rising home and business vacancy rates indicate an abundance of land with little demand for its use.

To many in the Adirondack Park, hamlet expansion means obtaining an APA map amendment that reclassifies land into the APA Hamlet classification; however, more Hamlet-classified land does not necessarily lead to new development. Smart growth means a hamlet grows in a manner that increases economic viability and improves quality of life without sacrificing the region’s natural resources or Adirondack aesthetic. Whether or not a map amendment is necessary to achieve this should be determined through a planning process including a market analysis and an inventory of existing developable parcels within or immediately adjacent to a hamlet’s existing footprint.

Ways to expand: inward vs. outward
Once a demand for expansion has been established, a hamlet must choose the best type of expansion for its needs. Without any effort to plan, Adirondack hamlets grow incrementally, one lot at a time and usually along the lines of existing infrastructure such as roads, water and sewer lines. On the other hand, a proactive physical plan, along with financing for access and infrastructure, maximizes the use of land within and around existing hamlets and maintains the region’s quality of life.

Inward growth happens within the existing hamlet footprint and can include:

Building reuse – repurposing vacant or obsolete buildings, including vacated schoolhouses, obsolete factories/mill buildings, churches, gas stations, empty storefronts, carriage houses, seasonal cottages, and garages.

Infill on vacant land – developing underutilized sites, brownfields, and areas not served by roads.

Dividing / reconfiguring lots – maximizing use of land within existing hamlets by subdividing “estate”-size lots large enough to accommodate several additional dwelling units.

Existing buildings have the potential to provide for residential and commercial growth inside a hamlet. Reconfiguring large, 19th century, “white elephant” houses often allows for additional dwelling units or accessory apartments. The lots on which such houses are located may also be large enough to accommodate several new dwelling units by dividing and/or reconfiguring the lots. Accessory structures, such as carriage...
Adaptive reuse of obsolete buildings
Infill on vacant / underused sites
Dividing / reconfiguring lots

INWARD – WITHIN HAMLET FOOTPRINT
• Adaptive reuse of obsolete buildings
• Infill on vacant / underused sites
• Dividing / reconfiguring lots

OUTWARD – BEYOND HAMLET FOOTPRINT
• Contiguous sites at the edge
• Linear hamlet extension
• Discrete development areas

Hamlets 3 introduces the concepts of “overlay”, “greenbelt” and inward-outward expansion.

WAYS TO EXPAND

Inward
• Adaptive reuse of obsolete buildings
• Infill on vacant / underused sites
• Dividing / reconfiguring lots

Outward
• Contiguous sites at the edge
• Linear hamlet extension
• Discrete development areas

Diagrams of a fictional Adirondack hamlet show six ways to expand.
Factors to consider
When assessing ways to expand, factors will include physical hamlet layout, availability of land, site constraints, infrastructure, land use, and regional location.

Physical layout
There are five typical hamlet layouts in the Adirondacks, each requiring different expansion design strategies. A community normally accumulates multiple layout characteristics as it grows and expands.

Concentric – Hamlets with concentric form usually have continuous “ribbon” development around a lake or other central feature. Several issues arise from this type of development, including the lack of a hamlet core, waterfront privatization, decreased water quality from dispersed or failing septic systems, and expensive infrastructure extension. Adirondack example: Star Lake

Grid – Grid hamlets consist of streets consciously planned at right angles, forming rectilinear blocks. While grids make communities easily understood by visitors and allow for controlled expansion, they do not respond well to changes in topography. Expanding within a hamlet grid requires redeveloping underutilized parcels, reconfiguring lots, or introducing new buildings on interior-block sites. Adirondack example: Port Kent.

Linear – Linear hamlets are strung out along a line, be it a roadway or a river. The dispersed, elongated nature of a linear hamlet can result in diminished visual quality because of automobile-dependent development. Such communities often lack a core or center. Hamlets of this type should interrupt the linearity with clustered human-scale developments. Adirondack example: Wilmington

Nodal – Nodal hamlets are defined by physical organization around a dominant, well-defined open space at the center of the hamlet, where pedestrian and vehicular traffic converge. In a nodal hamlet there is an obvious spatial definition, a clear sense of knowing when you have arrived or when you are there. Expansion should take into account the sense of human scale and the activities the node generates. Adirondack example: Jay

Crossroad – Crossroad hamlets, formed at the intersection of two or more transportation routes, often grew haphazardly from their original settlement nucleus. When pressures for expansion force hamlets to grow at their edges, they tend to transform into strip development. Infill along parallel or secondary streets close to the intersection combats this kind of sprawl. Adirondack example: Bloomingdale

Layouts of typical Adirondack hamlets inform expansion design.
**Land Availability**

Every hamlet has some available land for expansion; it is just a matter of locating the sites. A lost space analysis, or the process of locating parcels that are undeveloped or underutilized, can help communities find land suitable for density increase by infill development. In many hamlets, vacant land exists within the APA Hamlet district boundary and communities should consider expanding into these areas. Outward expansion should be explored only when limited land is available within the existing fabric and after infill opportunities have been exhausted.

**Site constraints**

The physical and natural constraints of the land should inform Adirondack hamlet expansion. GIS mapping software and data overlays can help facilitate analysis of these factors. *Hamlets 3* uses layers of data from the U.S. Geologic Survey (USGS), National Resources Conservation Service (NRCS), NYSDEC and the APA to analyze hydrography, wetlands, steep slopes, and Forest Preserve.

**Hydrography** – Surface waters, including lakes, ponds, rivers, and streams, have varying degrees of regulatory restrictions along their boundaries. Plotting these regulations onto maps yields an accurate representation of developable land.

**Wetlands** – Regulated by the APA, wetlands and their boundaries should be preserved, as they are critical habitats for various wildlife species and work to clean ground and surface water.

**Forever Wild** – made up of Forest Preserve lands classified under the State Land Master Plan as Wilderness, Wild Forest, Primitive, Canoe, Intensive Use, Historic, Wild, Scenic and Recreational Rivers, Travel Corridors and State Administrative Areas.

**Slope** – Steep slopes in the Adirondacks are expensive to build on and are susceptible to erosion and negative impacts on water systems. Slopes above 15% grade should be considered generally unbuildable.

*In Westport there is developable land at the hamlet’s northern boundary, but with challenging topographic conditions.*

*GIS mapping of Elizabethtown’s natural resources determines constraints and opportunities for expansion.*
Infrastructure
Road, water, sewer, and other municipal infrastructure are critical factors in the demand for and design of hamlet expansion. If it is in the public interest to encourage smart growth of a hamlet, then innovative ways of financing the necessary infrastructure will have to be developed. Broadband infrastructure, health services, and business support networks also work to attract new investors and residents to Adirondack hamlets.

FUNDING INFRASTRUCTURE NECESSARY FOR HAMLET EXPANSION CAN BE PROBLEMATIC.

Land use circumstance 1
The Adirondack Park Agency’s land use restrictions are an important factor in hamlet design and expansion. Diverse land use circumstances are found throughout the park, illustrating the need for a process that incorporates variation. In this context, it is easier to expand into Moderate Intensity land than it is into the highly restrictive Resource Management areas. Cranberry Lake’s land use situation limits its outward growth potential while Pottersville could easily expand into Moderate Intensity regulated areas near the hamlet center.
**Land Use circumstance 2**

About half of the park is state-owned land which greatly influences a hamlet’s potential for outward expansion. Almost all of this land is designated Forever Wild, precluding any potential for development. Hamlets such as Piseco, that do not have APA Hamlet-designated areas and are surrounded by significant amounts of state land, must seek inward, place-enhancing development in Moderate Intensity areas to further their economic growth.

**Regional context**

The Adirondack Park contains numerous sub-regions. The first phase of this work, *Hamlets of the Adirondacks*, grouped hamlets around shared geographic characteristics, finding nineteen distinct groups. The character of each group was derived from its landscape setting and relationship to similar ecosystems such as large lakes, river systems, upland habitats, or tracts of common wilderness. Cities just beyond the Adirondack Park boundary, including Plattsburgh, Glens Falls, Watertown, and Utica, influence the economies and functions of nearby hamlets. These varying regional conditions have a significant impact on hamlet expansion.

*Settlement is concentrated at the Park’s perimeter, influenced by larger cities beyond the Blue Line; large tracts of wilderness land occupies the center.*
**Cluster configurations**

Hamlets never stand alone; rather they exist in clusters that share commercial, civic, and recreational resources. There are four types of hamlet cluster configurations in the Adirondack Park:

- **Center-satellite** – a large, principal hamlet surrounded by smaller hamlets.
- **Multi-nodal** – a group of equally-sized hamlets
- **Urban symbiosis** – hamlets at the periphery of the park near a major urban center.
- **Hamlet necklace** – a series of hamlets strung out in a row.

The cluster configurations point to diverse approaches to smart growth planning. Elizabethtown, Old Forge, and Star Lake clusters represent three distinct sub-regions in the park and embody characteristics of all four cluster configurations. Each cluster also has a different social, economic, historic and ecological purpose, allowing for study of hamlet expansion in the park’s widely diverse places. Thus, they were selected for *Hamlets 3* field analysis.

*Historically, the clusters were shaped by watersheds, transport routes, geography and economics.*

**HAMLETS NEVER STAND ALONE BUT ARE CLUSTERED AROUND SHARED RESOURCES.**

*Three clusters were selected for field analysis: Elizabethtown, Old Forge, and Star Lake.*
